Histogram of n_j vs truncated-Poisson prediction
Sample1_pt1 | χ^2: sp=23911, curve=23111
Single-point $\hat{\lambda}$ = 0.742
Curve-fit $\hat{\lambda}$ = 0.751
Observed
Count (log scale)
n_j (reads per molecule)
Sample1_pt2 | χ^2: sp=24529, curve=23659
Single-point $\hat{\lambda}$ = 0.837
Curve-fit $\hat{\lambda}$ = 0.847
Observed
Count (log scale)
n_j (reads per molecule)
Sample1_pt3 | χ^2: sp=11402, curve=11094
Single-point $\hat{\lambda}$ = 0.780
Curve-fit $\hat{\lambda}$ = 0.788
Observed
Count (log scale)
n_j (reads per molecule)
Sample2 | χ^2: sp=54731, curve=53282
Single-point $\hat{\lambda}$ = 1.201
Curve-fit $\hat{\lambda}$ = 1.217
Observed
Count (log scale)
n_j (reads per molecule)
